TSB0104: 2004 King 50 rear brake plunger retaining clip

April 1, 2004

The retaining clip that holds the rear brake plunger into position can fall off if not installed correctly. The retaining clip MUST be installed as shown in Figure 1 such that the body of the clip, prior to snapping into it's locked position, is located in front of the plunger.

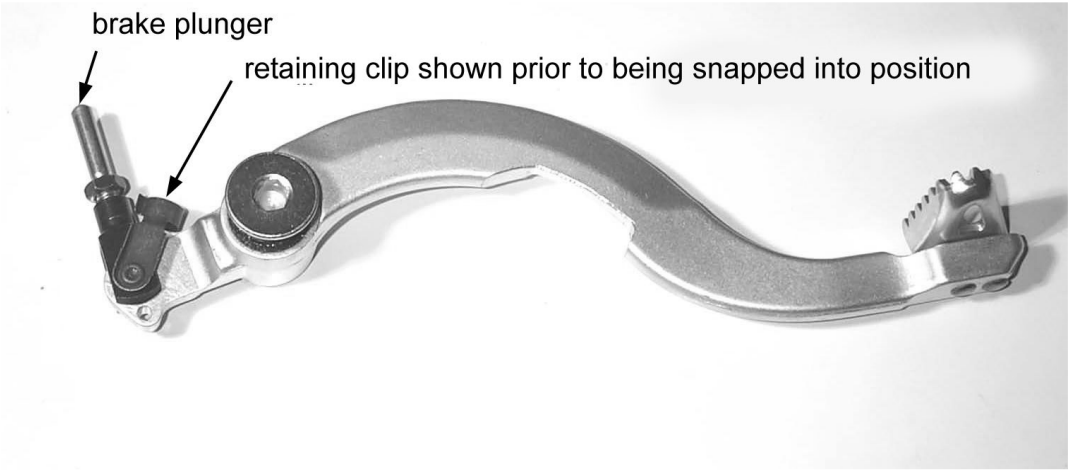

Figure 1

The retaining clip is then locked into position by rotating it backwards (counter clock-wise) until it snaps onto the brake plunger (Figure 2). Safety wire or a cable tie can also be installed to insure it stays in position.
